

QuietCare[®]: Innovative Technology; Proactive Care

QuietCare is sophisticated software made up of small wireless motion sensors strategically placed inside our apartments, which track activity as the tenant moves around. The system then compiles their movement into data which is transmitted to a secure central computer, essentially learning each tenant's daily in-home routine. The software can then recognize any movement that seems out-of-the-ordinary and alerts staff so they can respond promptly in case of a potential emergency.

QuietCare is silent and does not require your loved one to push any buttons or wear any pendants. The wireless motion sensors also provide total privacy, as no cameras or microphones are used. QuietCare, when integrated into our care planning and delivery, provides staff with insights to best meet the needs of tenants, while providing peace of mind for their loved ones.
